Team ID	Solo Project – Individual Capstone
Project Name	Library Management System (ServiceNow)
Maximum Marks	2 Marks

Problem - Solution Fit Canvas: Library Management System (ServiceNow)

1. CUSTOMER SEGMENT(S) Students who borrow books; Librarians who manage the catalog & approvals at the college library.	2. JOBS-TO-BE-DONE / PROBLEMS Students: check availability & track requests without visiting the counter. Librarians: approve requests, update stock, generate reports without manual paperwork.	3. TRIGGERS A student needs a book urgently for an assignment/exam and finds the counter queue too slow; a librarian is asked for a "most borrowed" report with no fast way to produce it.	4. EMOTIONS: BEFORE / AFTER Before: frustrated, uncertain, overworked. After: confident, in control, efficient — request status is always visible.
6. CUSTOMER CONSTRAINTS Built and demonstrated on a personal ServiceNow Developer Instance (PDI); college-wide rollout would need IT approval & a provisioned instance; students on campus limited hours.	5. AVAILABLE SOLUTIONS Paper registers to log issues/returns; phone calls or in-person visits to check availability; separate spreadsheets kept by librarians for reporting.	9. PROBLEM ROOT CAUSE The library's borrow-tracking process was never digitized, so there is no shared, real-time source of truth on book status between students and staff.	7. BEHAVIOUR Students queue at the counter to ask about availability; librarians manually flip through registers to update status and tally borrow counts at month-end.
10. YOUR SOLUTION A ServiceNow app (built on a personal Developer Instance) with Student/Librarian roles, Book & Borrow Request tables, Flow Designer approvals, ACLs, and a "Most Borrowed Books" report.	8.1 ONLINE College portal / email announcements about the new library service. 8.2 OFFLINE Library counter signage; notice board; orientation sessions for new students.		
PURPOSE / VISION Replace a slow, manual, paper-based book-borrowing process with a self-service, role-based ServiceNow application that gives students real-time visibility into book availability and gives librarians automated approvals and data-driven reporting. Currently proven on a personal Developer Instance as a proof of concept ahead of institutional rollout.
